California Voter's Choice Act: Los Angeles County March Primary 2020 Evaluation

The Secretary of State's office commissioned research from the California Institute of Technology (Caltech) to provide an analysis of Los Angeles County's implementation of the Voter's Choice Act during the March 2020 Primary Election. Caltech's report, *California Voter's Choice Act: Los Angeles County March Primary 2020 Evaluation*,¹ includes an overview of the Voter's Choice Act (VCA), Los Angeles County's implementation of the VCA in the March 2020 Primary Election, and the county's "Voting Solutions for All People" (VSAP), implemented for the first time in this election. Data sources for this research include the Secretary of State's centralized voter registration database, VoteCal, survey and other qualitative data sources.

Background

The statutory framework for the analysis in this report derives from Section 4005(g)(1)(A)(i)-(xii) of the California Elections Code.² This statute obligates the state to report on voter registration and the various methods voters can use to participate in an election. Los Angeles County accounted for more than half of all VCA county voters in the March 2020 Primary Election and was analyzed separately due to its size.

The March 2020 Primary Election occurred just prior to statewide stay-at-home orders due to the COVID-19 pandemic, limiting any impact of the pandemic on election administration in the county.

Findings

The study shows that voter registration in Los Angeles County among eligible voters is higher than voter registration among eligible voters statewide.³ Voters

¹ Alvarez, R.M., Cao, J., Ebanks, D., Guth, D., Li, Y. (2021, January 14). *California Voter's Choice Act: Los Angeles County March Primary 2020 Evaluation*. California Institute of Technology.

² Elections Code Section 4005(g)(1)(A)(i)-(xii) provides: (i) Voter turnout. (ii) Voter registration. (iii) Ballot rejection rates. (iv) Reasons for ballot rejection. (v) Provisional ballot use. (vi) Accessible vote by mail ballot use. (vii) The number of votes cast at each vote center. (viii) The number of ballots returned at ballot dropoff locations. (ix) The number of ballots returned by mail. (x) The number of persons who registered to vote at a vote center. (xi) Instances of voter fraud. (xii) Any other problems that became known to the county elections official or the Secretary of State during the election or canvass.

³ California Voter's Choice Act: Los Angeles County March Primary 2020 Evaluation (Page 6, page 17 Figure 3.1)

used conditional voter registration more often in Los Angeles County than in other counties and was used most by younger voters and those not affiliated with the Democratic or Republican parties.⁴

Though voter turnout in Los Angeles County is lower than the statewide participation rates in recent elections, participation among eligible voters has been increasing since the 2014 Primary Election.⁵ Caltech's research shows that Democrats and Republicans had the highest turnout rates⁶ along with a positive correlation between age and voter turnout,⁷ consistent with the Secretary of State's analysis of VoteCal data. Use of vote by mail has increased in the county but has not surpassed statewide use.⁸

Los Angeles County encountered technical issues with electronic poll pads at vote centers causing a need for provisional voting.⁹ However, even with this issue, provisional voting decreased in the Primary Election. One feature of the VCA model allows voters to vote at any vote center in the county.¹⁰ Those who voted provisionally were younger and less likely to be affiliated with the Democratic or Republican parties.¹¹

Interestingly, ballot rejection rates decreased in the 2020 Primary Election from the 2016 and 2018 Primary Elections.¹² Approximately four percent of provisional ballots and two percent of vote-by-mail (VBM) ballots were rejected in Los Angeles County in the 2020 Primary Election.¹³ The most common reasons for provisional ballot rejections were that the voter had already voted or the ballot was missing from the envelope.¹⁴ The most common reasons for VBM ballot rejections were due to the ballot not being received on time or a missing

signature.¹⁵ VBM ballot rejections were more prominent with younger voters and voters who were not registered as Democrats or Republicans.¹⁶

The Los Angeles County Elections Office engaged voters before and during the election through broadcast media, newspapers, radio, social media, direct mail, and community events to inform them about voting options and the election.¹⁷

Research showed no allegations of voter fraud or problems reported during the canvass period.¹⁸ Issues during the election centered around the electronic pollbooks synchronization issues, which caused increases in wait times and vote center lines.¹⁹ Other issues included some voters not receiving vote-by-mail ballots as scheduled or an incorrect ballot style.²⁰ This challenge is not unique to VCA counties and can be mitigated by voters confirming and updating their registration status 30 days prior to any election, including verifying their correct mailing address and specifying a ballot language preference.

Recommendation

Caltech recommends ongoing monitoring to confirm that the issues identified in the 2020 March Primary Election, such as long wait times and line length, were resolved.²¹

California Institute of Technology
Sponsored by the California Secretary of State

January 14, 2021

Preface

This report was produced by researchers at the California Institute of Technology (Caltech), for the California Secretary of State's Office. The Caltech research team is part of the Monitoring the Election project at Caltech and the Caltech/MIT Voting Technology Project.

About the authors

R. Michael Alvarez, Ph.D. Principal Investigator for this research report, Alvarez is a Professor of Political and Computational Social Science at Caltech. He is the co-director of the Caltech/MIT Voting Technology Project and PI of the Monitoring the Elections Project.

Jian Cao, Ph.D. Jian is a Postdoctoral Scholar in Data Science and Election Integrity at Caltech. He received his M.S. and Ph.D. in Economics from Florida State University. Prior to his graduate work, he received a Master of Financial Engineering degree from the China University of Mining & Technology in 2014.

Daniel Ebanks. Daniel Ebanks is a Ph.D. Graduate Student in the Social Sciences at Caltech, with a research focus on elections and statistical methods. He earned his A.B. in Public Policy and International Affairs at Princeton University.

Daniel Guth. Daniel Guth is a Ph.D. Candidate in Social Sciences at Caltech. He has a B.S. in Mathematics from Caltech, and his research focuses on public policy, in particular health care and public health.

Yimeng Li. Yimeng is a Ph.D. Candidate in Social Sciences at Caltech. He holds an MSc in Econometrics and Mathematical Economics with Distinction from London School of Economics and Political Science, and is the co-author of the book *Securing American Elections: How Data-Driven Election Monitoring Can Improve Our Democracy* recently published in the Elements in Campaigns and Elections series by Cambridge University Press.

About the Monitoring the Election Project

The Monitoring the Election project was founded in 2018, with financial support from the John Randolph Haynes and Dora Haynes Foundation. The initial phase of the project in 2018 was a pilot study that implemented various election auditing, forensic, and monitoring methodologies, focusing on Orange County (CA). The project expanded scope in 2020, covering Southern California (with a focus on Orange and Los Angeles Counties), as well as providing forensic election integrity analysis statewide. Details about the project can be found at <https://monitoringtheelection.us>.

About the Caltech/MIT Voting Technology Project

The Caltech/MIT Voting Technology Project was established immediately following the 2000 presidential election. The presidents of Caltech (Dr. David Baltimore) and MIT (Dr. Charles Vest) assembled a team of computer scientists, economists, human factors experts, mechanical engineers, political scientists, and operations researchers to undertake the research necessary to solve the issues seen in the 2000 Presidential election. In the years since the project's founding, the VTP has continued to develop science-based solutions for election administration and technology issues, in the United States and abroad. The VTP is currently directed by Dr. R. Michael Alvarez (Caltech) and Dr. Charles Stewart III (MIT). See <https://vote.caltech.edu>.

Acknowledgments

The authors would like to thank the following for their assistance with this report (in alphabetical order): Fernando Guerra and Brianne Gilbert from Loyola Marymount University for giving us the opportunity to use their March 2020 Los Angeles County exit poll data; Sabrina Hameister for providing assistance with all stages of this project; Claudia Kann and Seo-young Silvia Kim for their work with us on related projects; Paul Mitchell and the team at Political Data Inc. for giving us access to their data system and providing important data for this report; Mindy Romero for her input regarding California's VCA, her work on a related VCA study, and for help with access to important data from Political Data Inc.; Zev Yaroslavsky and Alisa Belinkoff Katz from UCLA's Luskin Center for History and Policy for providing access to data from their March 2020 Quality of Life survey (and thanks as well to Adam Sonenshein from Fairbank, Maslin, Maullin, Metz & Associates for details about the survey methodology).

1 Executive Summary

In this report we conduct an analysis that provides a quantitative evaluation of Los Angeles County's implementation of the California Voter's Choice Act (VCA) in the March 2020 presidential primary election.

The report is broken into eight primary sections. The first section provides an overview of the details of the VCA and the specifics of Los Angeles County's implementation in the March 2020 primary, as well as details of Los Angeles County's "Voting Solutions for All People" (VSAP), which was also implemented for the first time in the primary election in Los Angeles County. We then discuss our research objectives in this first section and elaborate on the details of our methodological approach.

The subsequent sections provide detailed analyses of voter registration, voter participation, provisional ballot use, ballot rejections, outreach by the Los Angeles County Registrar-Recorder/County Clerk (LACRR/CC), the absence of allegations of voter fraud, and problems that arose during the primary and canvass periods.

Highlights of our conclusions for each section are:

1. Voter registration:

- Voter registration rates for recent primary elections have been increasing since 2008, and the rate of registration among eligible voters is greater in Los Angeles County than it is statewide.
- Registration activity increased in Los Angeles County in the days immediately prior to the deadline to register for the primary election.
- Conditional voter registration was more widespread in Los Angeles County than in other counties in California.
- Those who registered conditionally for the March 2020 primary election were typically younger and less likely to register with the two major parties.

2. Voter participation:

- Voter participation in Los Angeles County, among eligible voters, has been increasing in recent primary elections; voter turnout among registered voters has been increasing since the 2014 primary election
- Voter participation in Los Angeles County for both eligible and registered voters is lower than the statewide participation rates in recent statewide primary elections.

- There has been an increasing use of voting-by-mail in Los Angeles County in primary elections, though the rate of voting-by-mail in Los Angeles County is lower than that statewide.
- Most vote-by-mail ballots were returned by mail in the 2020 primary election, and according to the data we have, most of those arrived immediately before the March 2020 primary.
- Voter participation is correlated with age, which is consistent with other studies of voter participation. We also see that in the March 2020 primary, Los Angeles County voters registered as Democrats or Republicans had higher turnout rates than voters registered with other parties or as No Party Preference.

3. Provisional ballot use:

- Provisional voting decreased in the March 2020 primary, which is attributable in part to the VCA.
- However, many provisional ballots cast in the March 2020 primary in Los Angeles County arose because of technical issues in the voting centers, as electronic poll pads had trouble synchronizing data with the central voter database; this implies there are still ways to reduce the number of provisional voters in future elections by improving the synchronization issues between the electronic poll pads and the central voter registration database.
- Finally, provisional voters tended to be younger, and less likely to be registered Republican or Democratic voters.

4. Ballot rejections:

- In the 2018 and 2020 primary elections, Los Angeles had significantly lower ballot rejection rates than the 2016 primary election.
- Approximately 96% of all provisional votes and 98% of all vote-by-mail (VBM) ballots in Los Angeles County were accepted in the 2020 primary election.
- In the March 2020 primary, both provisional and VBM ballot rejection rates were slightly lower than they were in the 2018 primary election.
- For provisional ballots, the most common reasons for rejection were that the voter already voted or the ballot was missing from the envelope.
- For VBM ballots, the primary rejection reason was that the ballot was not received on time, or it did not have a signature.
- Younger voters in Los Angeles County had higher rates of VBM ballot rejection than older voters, and voters who were not registered as Democrats or Republicans, or who were registered with No Party Preference, had higher rates of VBM ballot rejection than Democratic or Republican registered voters.

- Provisional ballot rejection rates were higher for older voters than for younger voters in Los Angeles County, and provisional ballot rejection rates were higher for voters registered with No Party Preference or who were not Democratic or Republican registered voters.

5. LACRR/CC outreach:

- LACRR/CC engaged in a substantial and multifaceted public outreach effort prior to and during the March 2020 primary election. LACRR/CC used a wide variety of approaches for these outreach efforts, including the use of broadcast media, newspapers, radio, social media, direct mail, and community events.
- One component of this outreach effort was to engage the community in the VSAP process, and to inform the community about the new VSAP technologies and procedures.
- A second component of this outreach effort was specific to the March primary itself, aimed at informing the community about their participation options, and providing various other types of information about the primary election.

6. Allegations of voter fraud:

- We have been unable to find any allegations of election or voter fraud in the March 2020 primary election in Los Angeles County.
- However, we note that at the point we write this report, the absence of allegations is an indication that it is unlikely that significant election or voter fraud occurred in this election.

7. Problems during the primary and canvass:

- Polling conducted on Election Day or after the primary election indicated that most voters reported positive experiences when they tried to vote.
- There were issues in vote centers, in particular with the electronic pollbooks that led to the use of provisional ballots and lines (in particular on Election Day, when turnout in vote centers increased relative to in the early voting period).
- The vote center lines and wait times occurred because of issues that the electronic pollbooks had synchronizing with the voter database during the March primary early and Election Day in-person voting.
- There were also two other issues that arose during the primary election, with some voters not receiving their vote-by-mail ballots as scheduled, and with some voters receiving an incorrect ballot style.
- There were no problems reported during the canvass that our research group has surfaced.

We also provide data appendices and other details of our methodologies at the end of this report.

2 Overview of the March 2020 Primary and Research Objectives

2.1 The California Voter's Choice Act

The California *Voter's Choice Act* (VCA) was enacted in 2016 and was designed to allow California counties to implement an innovative new approach to conducting elections, providing California voters with new and convenient opportunities to register, to receive their ballot, and to return or cast their votes. The main components of the VCA were that all registered voters would get a ballot in the mail (in most VCA counties); that voters could return their ballot by mail, by using a drop box in the county, or by visiting a vote center to return their mail ballot; voters could also have the opportunity to visit any vote center in their county of residence, and to vote there in person.

In the 2018 election cycle, five California counties implemented the VCA (Madera, Napa, Nevada, Sacramento, and San Mateo). Ten additional counties are implementing the VCA in the 2020 election cycle for their statewide primary and general elections (Amador, Butte, Calaveras, El Dorado, Fresno, Los Angeles, Mariposa, Orange, Santa Clara, and Tuolumne). All of these counties, except for Los Angeles County, are required under the VCA to:

1. Send a vote-by-mail ballot to every registered voter in the county.
2. Provide at least two ballot dropoff locations in the jurisdiction holding elections, or provide a fixed number of ballot dropoff locations so that there is at least one ballot dropoff location for every 15,000 registered voters in the jurisdiction holding elections.
3. Starting ten days before, and running through the fourth day before Election Day, provide at least one vote center for every 50,000 registered voters in the jurisdiction holding elections, open for at least eight hours per day.
4. Provide a vote center for every 10,000 registered voters in the jurisdiction holding the election that is open 7am to 8pm on Election Day, and which would be open for at least 8 hours per day on the three days before Election Day.

However, Section 4007 of the state's election code allows Los Angeles County to conduct VCA-style elections, starting in January 2020, under a different set of conditions for the March 2020 primary election:

1. Los Angeles County was not required to send to every registered voter a vote-by-mail ballot. Rather, Los Angeles County was required to send vote-by-mail ballots to (in addition to those who requested them for the March 2020 primary election):
 - Every registered permanent vote-by-mail voter.
 - Every voter who resides in a precinct with fewer than 500 registered voters (those precincts are designated as vote-by-mail precincts).
 - Voters who live in state legislative or federal congressional districts that span Los Angeles and other neighboring VCA counties.
 - Voters from precincts that are more than 30 minutes' drive from a vote center, or who live in a precinct that is more than 15 miles from the nearest primary election vote center.
2. Los Angeles County was to provide at least two ballot drop-off locations in the jurisdiction holding an election, or provide at least one ballot drop-off location for every 15,000 registered permanent vote-by-mail voters in the jurisdiction holding an election.
3. Provide at least one vote center for every 30,000 registered voters within the jurisdiction holding an election, starting ten days before Election day through the fourth day before Election day, open for at least eight hours per day.
4. Provide on Election day, and the three days prior to Election day, at least one vote center for every 7,500 registered voters. The vote centers were to be open for at least eight hours per day before Election day, and from 7am to 8pm on Election day.
5. Los Angeles County was to conduct and release an analysis of their vote center plans, determine any service gaps, and release this report to the public.

2.2 Voting Solutions for All People

At the same time as the VCA was implemented in Los Angeles County, another important innovation was launched by Los Angeles County Registrar-Recorder/County Clerk (LACRR/CC). The March 2020 primary election was the first major statewide election using LACRR/CC's "Voting Solutions for All People" (VSAP) voting technologies and procedures. The VSAP initiative began in 2009, and involved years of work with collaborations between LACRR/CC, academic research groups (including the Caltech/MIT Voting Technology Project), community partners, and stakeholders. It also involved many avenues for community input and participation in the development of Los Angeles County's new and unique approach for vote center operations.

The VSAP initiative was an ambitious re-imagining of a voting experience that would fit the unique needs of Los Angeles County voters. Los Angeles County is one of the largest election jurisdictions in the world, with an estimated 6.1 million eligible voters, and as of January 2020, 5.4 million registered voters.¹ Los Angeles County is very large geographically, ranging from desert and coastal mountain ranges to the Pacific Ocean, covering 4,105 square miles. LA County's population is racially and ethnically diverse, with balloting materials provided in thirteen languages (including English), for the March 2020 primary election. Administratively, of the 5.4 million registered voters prior to the March 2020 primary, nearly 3 million were registered as permanent vote-by-mail voters, with nearly 13,000 overseas and approximately 4,000 military voters. With the size and complexity of Los Angeles County, the primary election ballot was complex, including not only the presidential primary candidates but also an array of federal and state legislative candidates, local candidates in some areas, as well as local, county, and state ballot measures — in total there were 524 different ballot groups for the March 2020 primary election.

The VSAP was designed to handle the complexity of Los Angeles County election administration, using a vote center approach. As noted earlier, for the March 2020 primary, most but not all of Los Angeles County's registered voters would receive a ballot in the mail (keeping in mind that the 3 million permanent vote-by-mail voters would automatically get a mail ballot, as would voters in the various special situations listed above).

In the March 2020 primary, LA County had nearly 972 vote centers deployed as of early February 2020. With the VSAP process implemented within the California VCA framework, LA County voters had many different options for the March primary:

- Those who automatically received a ballot in the mail, or who requested a ballot in the mail, could return their voted ballot by mail, or by taking it to a vote center, a ballot drop box, or other ballot drop-off locations.
- Those who preferred to vote in person could visit any vote center in Los Angeles County, during the early voting period or on Election day (and a further description of the VSAP vote center approach is below).
- Voters with special needs could use Los Angeles County's remote vote-by-mail process, allowing them to obtain and mark their ballot in private on their own accessible electronic devices.

Specifically, those who decided to mark and cast their ballot in person witnessed a new and very different experience in the March 2020 primary under the VSAP/VCA model in

¹The statistics in this section are from the Los Angeles County Registrar-Recorder/County Clerk's Media Kit for the March 3, 2020 Presidential Primary Election, available at https://www.lavote.net/docs/rrcc/media/Media-Kit_03032020.pdf.

Los Angeles County. During an 11-day period, voters could go to any open vote center in the county, which they could locate by going to LAVote.net or by using the informational guide mailed to every household in Los Angeles County. Once in the vote center, registered voters would check in with a vote center staff member, who would use an electronic pollbook to confirm the voter's registration status in the county. The electronic pollbooks were connected to the voter registration database, allowing vote center staff to confirm the voter's registration status in real-time.

Registered voters who were confirmed as eligible to vote in Los Angeles County (and who had not been recorded as returning a vote-by-mail ballot if one was sent to them) were then given a printed blank ballot, and told to use any of the available ballot marking devices (BMDs) in the vote center. The ballot marking devices were designed to be easily accessible for all voters, and were programmed to provide all available ballot groups for all of the languages available to voters in the county. The voter inserted their blank ballot into the BMD's scanner, then used the touchscreen or accessible devices to select the language they wanted to use, and then could navigate and mark their ballot. When complete, the voter could review their choices on their paper ballot which had been marked with their choices. Once the voter had verified that their marked ballot was correct, they returned it by placing it in the BMD scanner where it was deposited into a secured ballot box attached to the rear of the BMD. Voters who preferred to use the BMD's audio functionality could do so in a number of languages.

LA County voters also had the option to use the Interactive Sample Ballot (ISB), which allowed them to use their own electronic device to make their selections. When the voter had marked their choices using the ISB, the application produced a QR code (called the Poll Pass). After checking in at a vote center, the voter could then scan their Poll Pass at the BMD, which transferred their selections from the ISB to the BMD. The voter could then review their choices on the printed marked ballot, and after verifying their choices, cast the ballot by re-inserting it into the BMD scanner. The ISB was designed to allow voters a fast and convenient way to use the BMD quickly.

A final aspect of the VSAP/VCA process in LA County's March 2020 primary needs mention. Individuals at vote centers who could not be confirmed as registered voters in Los Angeles County had various options, depending on the reason that they could not be confirmed. In cases where the electronic pollbook indicated no record for the individual, if otherwise eligible to vote in Los Angeles County, they could conditionally register to vote and cast a ballot at that time. In other situations, for example, if the voter stated they are registered but are not found in the database or if the electronic pollbook's ability to access the voter database was unavailable, the individual could cast a provisional ballot in the vote center.

2.3 The March 2020 primary context

In addition to the implementation of the VCA and VSAP in Los Angeles County for the March 2020 primary election, there are a number of other aspects of the election's context that are important for evaluation of election administration and technology in this election.

First, it is important to remind readers that primary elections in California are governed by a complex set of procedures. As the 2020 March primary was a statewide primary election, it was conducted using California's "top-two" primary system (Alvarez and Sinclair, 2015). Under the top-two primary system, most candidates run for "voter-nominated" offices; however the top-two primary process is not used for candidates running for local offices, for county central committees, or in the U.S presidential primaries. For the U.S. presidential primaries, qualified parties can hold either a closed primary (only voters registered with that party can get a ballot for that party's presidential primary) or a modified-closed primary (the party's registered voters and No Party Preference voters can get a ballot for a party's presidential primary). Second, adding to the complexity of the March 2020 primary, the ordering of candidate races and ballot measures was based on Senate Bill 25 (passed in 2018), which applied only to Los Angeles County.² This legislation changed the ordering of candidates and ballot measures relative to what Los Angeles County voters would have seen in past primary elections, with local races at the top of the ballot and the presidential primary at the end of the ballot. Finally, the 2020 California primary was held in March (most statewide primaries in recent history have been held in June). That meant that the timeline for LACRR/CC to implement the VSAP, and to get necessary certifications for the VSAP's technology, was compressed. Because of the presidential primary, there could be significant voter interest, and thus significant voter turnout.

Furthermore, because of VCA provisions, in particular because the VCA was being implemented in counties adjacent to Los Angeles County, a larger number of Los Angeles County voters received a ballot by mail in the March 2020 primary election. Many of these voters in these areas of Los Angeles County were receiving a by-mail ballot for the first time.

Second, a note about COVID-19. The March 2020 primary was conducted at the moment in time when the pandemic was largely at the early phases of its eventual first major surge in California (and in particular Southern California). This meant that precautions (like the use of personal protective gear by vote center staff and voters) were largely absent during the March 2020 primary, and thus the pandemic had little immediate impact on the implementation of the VCA and VSAP in Los Angeles County's March 2020 primary.

²See the bill text at https://leginfo.legislature.ca.gov/faces/billTextClient.xhtml?bill_id=201720180SB25

That was not the case for the 2020 general election, however, and that election will be the subject of an eventual second study from our research group later in 2020.

2.4 Research objectives

Implementation of both the new VCA model, as well as the technological and procedural changes brought by VSAP, is complex. Given the relatively recent implementation of the VCA, there have been few academic studies of the ramifications of the VCA in California; the few studies that have been conducted have generally tried to determine if VCA implementation has changed voter turnout (Bryant, 2019; McGhee et al., 2019; Morrow, 2019). Our analysis takes a broader perspective, as we seek to evaluate these VCA and VSAP implementations in Los Angeles County’s March 2020 primary election, using a variety of quantitative and qualitative data.

We structure our study around key questions regarding the VCA and VSAP implementations:

1. Impacts on voter registration (Section 3) and voter participation (Section 4).
2. Provisional ballot use (Section 5) and ballot rejections (Section 6).
3. Outreach and educational efforts by LACRR/CC (Section 7).
4. Allegations regarding voter fraud (Section 8) and problems during the primary and the canvass (Section 9).

Our intention is to provide a holistic evaluation of the election ecosystem, as proposed in the book by Alvarez, Atkeson and Hall (2012). Following their model, we use administrative data, survey data, in-person observational data, and other qualitative information, to produce a report that depicts the successes and the challenges in Los Angeles County’s first primary election experience with the VCA. We also hope that our report provides lessons for Los Angeles County’s future election administration, and for other California counties as they also implement the VCA.

2.5 Note about data sources

At the end of this report, we have a detailed appendix that contains more information about the data used in this study (Section 10). The primary datasets used in our work were provided to us by the VoteCal team in the California Secretary of State’s Office, which we received in early August 2020. The VoteCal team made every effort to provide

us with representative data for the March 2020 primary election. We also use election results reports from Los Angeles County and the Secretary of State, voter data from Political Data Inc., other administrative datasets from Los Angeles County, and polling data from academic colleagues.

However, administrative data are dynamic, sometimes contain errors, and various issues arise using snapshots of administrative data for past elections (see, for example, Kim, Schneider and Alvarez 2019). Where possible, we have attempted to validate the administrative data we have been provided, and we have conducted some data cleaning. We cannot absolutely verify the integrity of all of these data that we have been provided, and thus acknowledge that there may still be errors in the data we have used in this report, which might produce slight discrepancies between our study and others using similar data.

Finally, in this report, we attempt to make sure that we provide the appropriate context for the results we report, and we also attempt to put the results into their appropriate context. Given the dynamic nature of administrative data, and our use of data from varied sources, there may be minor differences or discrepancies between the statistics we report here and statistics that readers might find from other sources.

3 Voter Registration

3.1 Introduction

In this section we examine data on voter registration in Los Angeles County. We examine voter registration in Los Angeles County in previous primary elections (compared to state registration rates), and then present a more detailed analysis of voter registration at the pre-primary close of registration time. We also examine conditional voter registration in the March 2020 primary, and analyze voter registration by available voter demographics.

3.2 Voter registration in recent past primaries

The percent of eligible voters registered for the primary elections has steadily increased over the past decade for Los Angeles County (LAC) and statewide. In 2008, less than 70% of eligible voters in LAC and statewide were registered to vote for the Presidential primary election. By contrast, 90% of eligible voters in LAC and 82% of eligible voters statewide were registered to vote for the 2020 presidential primary election. Overall, 5.5 million LA voters and 20.7 million voters statewide were registered to vote in the presidential primary election in 2020. The rates of registration among eligible voters are provided in Figure 3.1. A table containing more detailed data is provided in the Appendix, in Table A1.

It's important to note that Figure 3.1 shows that the rate of registration among eligible voters in Los Angeles County has steadily diverged from the statewide rate of registration since 2008, especially since 2012. In 2008, the registration rate among eligible voters in LAC was slightly greater than statewide; but the difference between LAC and the statewide registration rates has grown to approximately 8% in 2020. The reasons for this divergence are beyond the scope of this report, but should be studied in future research. Hypotheses for the increase in the registration rate in Los Angeles County include outreach efforts by LACRR/CC (in particular their VSAP outreach efforts), the voter registration activities of other groups, and more generally voter interest in the 2020 primary and general election.

3.3 Voter registration on or before February 18, 2020 (deadline to register)

The deadline to register to vote in the March 2020 primary in California is February 18, 2020. Voters need to register before this date to cast regular ballots, or else they would

Rate of Registration among Eligible Voters

Primary Elections from 2008 to 2020

Source: Voter Participation Statistics by County, CA Secretary of State

Figure 3.1: Voter registration in recent past primaries

have to cast provisional ballots with conditional voter registration. Figure 3.2 provides the distribution of new or updated registrations since December 2019, through the deadline to register, for voters who participated in the March 2020 primary. Here we provide the data for Los Angeles County, the other VCA counties, and statewide. Appendix Table A2 provides detailed information on new or updated registrations before the March 2020 primary, aggregated to weeks, ranging from December 11, 2019 through February 12, 2020.

We see that a relatively low rate of new or updated registrations in December 2019 and January 2020. In mid-December, for example, there were 10,733 new or updated registrations during the week of December 11-17, 2019 in LAC. However, as the March 2020 primary registration deadlines approached, the rate of new or updated registrations began to increase in LAC in February 2020. On February 18 (close of registration), new or updated registrations before the primary elections peaked at just over 0.6% in Los Angeles County. In the first full week of February there were 29,792 new or updated registered voters in LAC (131,828 statewide), and 43,425 new or updated LAC registered voters the last week before the close of registration, February 12-18, 2020 (188,260 statewide new or updated registrations, for comparison). Finally, we see in Figure 3.2 a strong correlation between the distributions of registration dates in LAC, the other VCA counties, and statewide.

Daily Rate of New or Updated Registrations

Between December 2019 and February 2020

Source: Voter Registration File and Voter Participation History File, VoteCal

Figure 3.2: Proportion of new or updated registrations

In Table 3.1 we provide additional data on voter registration in Los Angeles County, just prior to the March primary. These data come from the 15-day statewide report on registration.³ Specifically, there were 5,546,785 registered voters in LAC just prior to the March primary, 89.69% of the eligible population. As we noted earlier, in the March 2020 primary election, the registration rate in LAC was higher than statewide (90% in LAC, relative to 82% statewide). We also see that as of the final registration report before the March primary, there were more voters registered as Democrats in LAC than statewide (52% relative to 45%), fewer Republicans in LAC than it was statewide (17% relative to 24%), and that the rate of No Party Preference voters was slightly higher in LAC than statewide.

³“Report on Registration as of February 18, 2020, Registration by County”, <https://elections.cdn.sos.ca.gov/ror/15day-presprim-2020/county.pdf> These data may vary slightly from other estimates we provide in this section, as those originate from other sources.

Table 3.1: Voter Registration as of February 18, 2020

	Los Angeles County	Statewide
Eligible	6,184,428	25,251,216
Registered	5,546,785 89.69%	20,660,465 81.82%
Democratic	2,869,677 51.74%	9,361,582 45.31%
Republican	935,133 16.86%	4,937,986 23.90%
Independent	132,867 2.40%	600,057 2.90%
Green	21,719 0.39%	83,281 0.40%
Libertarian	37,631 0.68%	125,352 0.85%
Peace and Freedom	34,117 0.62%	95,242 0.46%
Unknown	33,172 0.60%	104,680 0.51%
Other	43,143 0.78%	120,494 0.58%
No Party Preference	1,439,326 25.95%	5,181,491 25.08%

Source: Report of Registration, 2/18/2020

3.4 Conditional voter registration in the March 2020 primary

Eligible citizens in California can also register to vote conditionally. In Figure 3.3 we provide a first examination of conditional voter registration in the 2018 and 2020 primary elections, comparing LAC, other VCA counties, and statewide conditional voter registration. Here we provide the percent of conditionally registered voters, of registered voters who participated in the March 2020 primary election. Detailed information is in the Appendix, in Table A3. In the 2018 primary election, conditional registration was not widely used, as we see only 425 conditional registrants in LAC and 9,874 statewide.

However, in the 2020 primary election, conditional registration was more widely used. In LAC we see that conditional registrants comprised just over 2% of all voters in the March primary, as 43,669 conditional registrants are found in our data. Los Angeles County's rate (and number) of conditional registrations is greater than in other VCA counties, and the rate is higher than the statewide percentage (statewide, 1.6% of voters were conditionally registered voters, for a total of 154,867 statewide).

Percent of Conditionally Registered Voters

2018 and 2020 Primary Elections

Source: Voter Participation History File, VoteCal

Figure 3.3: Conditional Voter Registration, 2018 and 2020 Primaries

Why the rate of conditional voter registration was higher in Los Angeles in the March 2020 primary election is an important question. We hypothesize that it might be due to demographic differences between Los Angeles County and other VCA counties in California, perhaps also because of the unique timing of California's role in the 2020 presidential primary (with the primary in March, instead of the traditional June, there may have

been greater interest among some eligible voters in the primary election). It could also be the consequence of differences between Los Angeles County and other VCA counties in the number and distribution of vote centers in the March 2020 primary election, and to LACRR/CC's dissemination of information about conditional registration. At this point, though, further examination of this question is beyond the scope of this study and deserves attention in future research.

3.5 Analysis of voter registration by voter demographics

In this section we examine voter registration in the 2020 March primary in LAC by different voter demographics. Some of these demographic or political affiliations are derived from information in the voter registration database (age and party). Other demographic information (gender, race, and ethnicity) can be estimated using imputed quantities provided by PDI (information on registration by race and ethnicity is in the Appendix).

The age distribution of active registered voters in Los Angeles County, other VCA counties, and statewide, is shown graphically for the March 2020 primary in Figure 3.4. We provide detailed data in Appendix Table A4. Focusing on Los Angeles County, the figure shows that a plurality of the County's registered voters are 20-34 years of age (29% of the registered voters in the County, 1,579,333 registered voters). A quarter (25%) are 35-49, 24% are 50-64, and 22% are 65 and older. Note also that we break out the 18- to 19-year-old as an independent category here; we do so as this is the first statewide primary election for these registered voters, and we see that they make up a small proportion of the population of registered voters in Los Angeles County. In general, though, compared to other VCA counties, and the state, Los Angeles County's population of registered voters is considerably younger.

Figure 3.5 provides the active registered voter population by party registration, for the two major parties, for all third parties, and for those registered without a party preference. More detailed information is given in Appendix Table A5.

In Los Angeles County, a majority of voters are registered as Democrats (52% or 2,874,783 according to our data). That is a greater proportion of registered voters in the jurisdiction, than seen in other VCA counties or statewide. In Los Angeles County, 17% of the population of registered voters is Republican (933,135), while 5% (267,247) were registered with third parties. In the March primary, 26% of Los Angeles County's voters were registered as No Party Preference. In contrast to other VCA counties and the state, Los Angeles County had a greater proportion of voters registered with the Democratic party, and fewer voters registered with the Republican party. The proportions of LAC's registered voter population who in March were registered with third parties or as No Party Preference was about the same as in other VCA counties and statewide.

Age Distribution of Registered Voters

2020 Presidential Primary

Source: Voter Registration File, VoteCal

Figure 3.4: Age and Voter Registration, 2020 Primary

Next, Figure 3.6 provides estimates for voter registration by gender (detailed estimates are in Appendix Table A6). Among registered voters in Los Angeles County, these estimates are that 50% are female, 45% are male, and 5% are unknown. These estimates are similar to those for other VCA counties in California.

Finally, in Figure 3.7 we show the number of registered voters by U.S. Congressional district for the March primary in Los Angeles County. These data are provided in tabular form in the Appendix, in Table A7. In Figure 3.7 the vertical bar for each U.S. Congressional district provides the total number of registered voters; the yellow component of the bar shows the number of registered voters in Los Angeles County, the green component of the bar shows the number of registered voters who reside in other adjacent counties. The line above the bars gives the registration rate in each U.S. Congressional district (the percent registered of eligible voters in the district). Most of the registered voters in Los Angeles County are in U.S. Congressional districts that are largely or entirely in Los Angeles County; the exceptions are CDs 23, 25, 26, 27, 35, 38, 39, and 47 that overlap with other counties.

Figure 3.7: Registered Voters by Congressional District, 2020 Primary (Number of Registered Voters and Rate of Registration)

3.6 Analysis of conditional voter registration by voter demographics

In Figures 3.8 and 3.9 we examine the age and party registration distributions for conditionally registered voters in the March 2020 primary in Los Angeles County, other VCA counties, and statewide. In this section, we compute the percentages using all registered voters who participated in the March 2020 primary election. We provide in Appendix Tables A8 and A9 more detailed information regarding the age and party registration distributions for conditionally registered voters in the primary.

Percent of CVR Voters by Age

2020 Presidential Primary

Source: Voter Registration File and Voter Participation History File, VoteCal

Figure 3.8: Age and Conditional Voter Registration, 2020 Primary

Figure 3.8 shows that the 18- to 19-year-old voters constitute a large segment of the conditionally registered voters in the primary election. Roughly 13% of 18- to 19-year-old voters who participated in this primary election registered conditionally. Younger voters were more likely in Los Angeles County to conditionally register than in the rest of the state and than in the other VCA counties.

Figure 3.9 provides information on the partisan registration breakdown of the conditionally registered voters. Conditional registration was greater in Los Angeles County than in the rest of the state, and here we see that reflected for the various party registration categories. Moreover, we see that third-party and No Party Preference voters were more likely to conditionally register than either Democratic or Republican registered voters across the state, with the pattern most pronounced in Los Angeles County. Future research is warranted to fully understand the reason for this pattern we observe.

3.7 Conclusion

In this section, we analyzed voter registration in the March 2020 primary in Los Angeles County. Our analyses examined patterns of voter registration in recent past primary elections, and then dug deeply into data on voter registration and conditional voter registration, in the March 2020 primary election.

We found a number of interesting results in the analysis reported in this section. In no particular order, these results include:

- Voter registration rates for recent primary elections have been increasing since 2008, and the rate of registration among eligible voters is greater in Los Angeles County than it is statewide.
- Registration activity increased in Los Angeles County in the days immediately prior to the close of registration for the primary election.
- Conditional voter registration was more widespread in Los Angeles County than in other counties in California.
- Those who registered conditionally for the March 2020 primary election were typically younger and less likely to register with the two major parties.

4 Voter Participation

4.1 Introduction

In this section of our report, we examine voter participation in Los Angeles County primary elections in a number of different ways. We first present data that shows turnout among eligible and registered voters for Los Angeles County compared to the state, for primary elections between 2008 and 2020. Next we examine participation for the various modes of voting, focusing on the 2020 primary: in-person participation at vote centers, ballot drop-offs, ballots returned by mail, and remote accessible vote by mail. We then conclude, presenting data on voter participation by demographics.

4.2 Voter participation in Los Angeles County in recent past primaries

We present voter turnout in recent statewide primary elections in Figures 4.1 and 4.2, which provide the turnout rate for eligible voters and registered voters, respectively. The detailed data can be found in the Appendix, in Table A10.

Turnout among Eligible Voters

Primary Elections from 2008 to 2020

Source: Voter Participation Statistics by County, CA Secretary of State

Figure 4.1: Turnout among eligible voters in recent past primaries

While it is instructive to compare the turnout rate in the 2020 March primary to previous

Turnout among Registered Voters

Primary Elections from 2008 to 2020

Source: Voter Participation Statistics by County, CA Secretary of State

Figure 4.2: Turnout among registered voters in recent past primaries

statewide primaries, it is also important to note that the context of the 2020 March primary is very different from a number of these past primaries. First, since the 2012 primary election in California, the state has used the nonpartisan or “top-two” primary process, and used a different partisan primary procedure in 2008 and 2010. Second, the statewide primary in 2020 was held in March, while the earlier recent statewide primary elections were held in June. In the 2008 election cycle the presidential primary was in February, while the statewide primary was held in June. Finally, 2008, 2012, 2016, and 2020 were presidential primary elections, while 2010, 2014, and 2018 were midterm elections.

With those contextual differences in mind, in 2008, 38% of the eligible voters in Los Angeles County participated in the standalone Presidential Primary election (55% of registered voters). Turnout among both eligible and registered voters declined in the next three statewide primary elections, 2010, 2012, and 2014. In 2014, Los Angeles County turnout fell to 14% of eligible voters and to 17% of registered voters. Since 2014, turnout in Los Angeles County statewide primary elections has generally increased (with a decrease in the 2018 midterm election). In the 2020 primary, 34% of eligible Los Angeles County voters turned out, and 38% of registered Los Angeles County voters turned out. Numerically, 2,122,469 in Los Angeles County turned out to vote in the 2020 primary, just below the number who voted in 2008 (2,183,988).

The other clear tendency that we see in the turnout data shown in Figures 4.1 and 4.2 is

that turnout in Los Angeles County has consistently been lower than that seen statewide. For example, in the March 2020 primary, Los Angeles County turnout among eligible voters was 34%, while it was 38% statewide. There are many potential reasons for this consistent difference in turnout between Los Angeles County and the statewide turnout. For example, there might be important demographic differences between Los Angeles County's voting population and other counties in the state. Also, voter participation can be influenced by electoral competition and voter interest in the candidates on the ballot. At this point, a detailed analysis of these different potential explanations for why Los Angeles County turnout is consistently lower than the statewide turnout rate is beyond the scope of this study, but should be the focus of future research.

4.3 In-person, by-mail, and ballot drop-off

California voters have long been able to obtain and return a vote-by-mail ballot, or to vote in person. As described earlier in this report, while these basic voting options have long been available to Los Angeles County voters, important aspects regarding how voters obtain and cast ballots are changing with the VCA implementation in Los Angeles County. In the 2020 March primary, voters could obtain a ballot by mail upon request; 63% voters received them automatically (those who were registered as permanent absentee voters, voters in mail-ballot-only precincts, and voters in certain congressional or legislative districts that overlapped with Orange County, another VCA county).

These changes make it difficult to compare how registered voters cast their ballots in the 2020 primary, relative to past primaries. We present the proportion of voters who cast a vote-by-mail ballot in recent statewide primary elections in Figure 4.3. In Appendix Table A11 we provide detailed data on the number of in-person and vote-by-mail voters in Los Angeles County, and statewide, for the statewide primaries since 2008.

Perhaps the most interesting comparison is between the March 2020 primary and the June 2016 primary; both were presidential elections, both were held under the top-two process, and both had similar levels of voter turnout (41% of registered voters turned out in the 2016 primary in Los Angeles County, compared to 38% in the 2020 primary). In 2016, just over a third of Los Angeles County voters cast a ballot by mail (722,079). In the 2020 primary, the rate of ballots cast by mail increased to 54% in Los Angeles County, as 1,141,594 voters participated by mail. There is a corresponding decline in the number of in-person votes cast between the 2016 and 2020 primaries, going from 1,303,989 to 980,875 in the 2020 primary election.

While there is increasing use of voting-by-mail in Los Angeles County primaries, the County still lags behind the use of voting by mail statewide. This is shown graphically in Figure 4.3, where we provide the percentages of ballots cast in recent primary elections in

Percent of Vote-by-Mail Voters

Primary Elections from 2008 to 2020

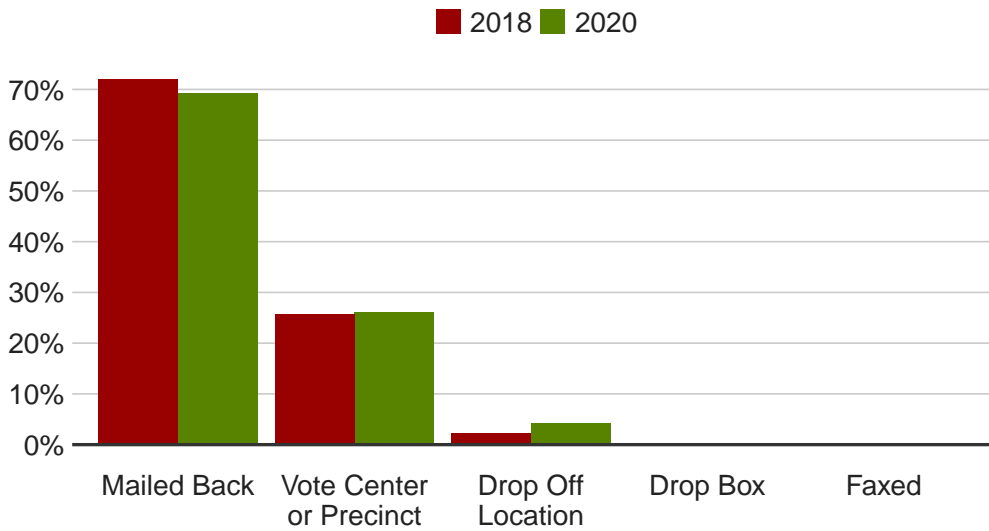

Source: Voter Participation Statistics by County, CA Secretary of State

Figure 4.3: Voting by mail, 2008-2020

VBM Ballots Return Methods

2018 and 2020 Primary Elections

Source: Vote-by-Mail Ballot File, VoteCal

Figure 4.4: VBM ballots return method, 2018 and 2020 primaries

Los Angeles County and statewide. There is a consistently lower rate of voting by mail in Los Angeles County since 2008, with Los Angeles County's rate of voting by mail being consistently about 20% lower than the statewide percentage (Los Angeles County's rate of voting-by-mail was 18% lower in the 2020 primary).

In recent primary elections, Los Angeles County voters have had different ways to return their vote-by-mail ballot. They can mail it back, they can drop it off at a precinct (2018 primary) or vote center (2020 primary), or they can drop it off at a drop box or other drop-off location. We present in Figure 4.4 data on how vote-by-mail ballots were returned in Los Angeles County, in the 2018 and 2020 primaries. More detailed data on the vote-by-mail ballot return is in Appendix Table A12.

In the 2018 and 2020 primaries in Los Angeles County, most of the vote-by-mail ballots were returned by mail: 72% in 2018 and 69% in 2020. Nearly a quarter were returned to a precinct or vote center in both primary elections, and few were dropped off at a drop box or other drop off location (2% in 2018 and 4% in 2020).

Another important question regarding by-mail ballots is when they are returned. Our data has a time-stamp for when the ballot was marked as returned, and in Figure 4.5 we provide the number of vote-by-mail ballots returned daily for the March primary, and in Figure 4.6 we give the number of ballots that were dropped off daily for the March primary. Detailed data are provided in Appendix Tables A13 and A14. Ballots returned by mail came in at a steady rate starting in mid-February, but the peaked around Election day. Ballots were dropped off in early March, peaking around Election day.

4.4 Remote accessible vote by mail

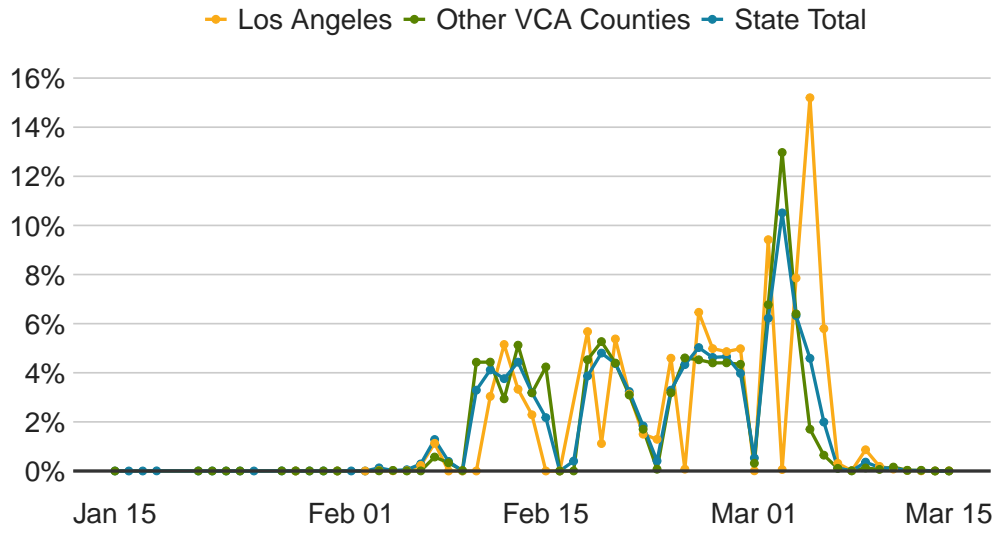

California now allows registered voters with disabilities the opportunity to use a remote accessible vote by mail ballot (RAVBM). RAVBM systems are designed so that voters with disabilities can view and mark their ballots using their own electronic assistance technologies. In the March 2020 primary election, Los Angeles County used the "Voting Systems for All People Interactive Sample Ballot." The LAC RAVBM system provided a web-based interface that an eligible voter could use to view and mark their ballot; eligible voters could also use a screen reader to navigate through their ballot. After marking and reviewing their RAVBM ballot, the voter would print and return the printed ballot to LACRR/CC (by mail, at a drop box, or at a vote center).⁴

Information reported by LACRR/CC to the CASOS indicated that LAC's RAVBM was available to eligible voters between E-29 and E+1 (29 days before Election Day, and one

⁴Additional details about LAC's RAVBM are available online at <https://lavote.net/home/voting-elections/voting-options/vote-by-mail/ravbm>.

day after Election Day). A total of ten voters used LAC’s RAVBM in the March 2020 primary (statewide 6,205 voters used RAVBM in the March 2020 primary). None of LAC’s RAVBM voters were indicated to be UOCAVA voters, and LAC reported no problems with the use of their RAVBM system in the March 2020 primary.⁵

4.5 Analysis of voter participation by voter demographics

Next we present turnout (for registered voters) by voter demographics, starting with age (Figure 4.7, with detailed data in Table A15). There is extensive academic literature on voter participation, and many factors have been identified in this literature as being correlated with voter turnout in elections (for example, see Leighley and Nagler 2014). Our data is limited to only a small set of voter attributes, primarily age and party registration from the voter file, and estimates of the voter’s gender and race/ethnicity.

In the March 2020 primary, voter turnout in Los Angeles County is positively correlated with age. Twenty-eight percent of younger voters (20 to 34) turned out to vote, while 33% of voters aged 35 to 49 voted. Higher turnout rates occurred for Los Angeles County voters aged 50 to 65 (43%) and those aged 65 and older (52%).

Turnout among Registered Voters by Age

2020 Presidential Primary

Source: Voter Registration File and Voter Participation History File, VoteCal

Figure 4.7: Turnout and Age

⁵These data were provided to the authors by the California Secretary of State’s Office.

We see that turnout is also positively correlated with age in the other VCA counties, and statewide. The difference in turnout between voters aged 65 and older and those aged 20 to 34 was 24% in Los Angeles County. However, the differential was much greater in the other VCA counties (44%) and statewide (36%). The reasons for these differences require additional study.

Turnout among Registered Voters by Party

2020 Presidential Primary

Source: Voter Registration File and Voter Participation History File, VoteCal

Figure 4.8: Turnout and Party Registration

In Figure 4.8 we provide the data graphically for voter turnout by party registration, for registered voters. Detailed data is provided in Table A16. In the 2020 March primary, 45% of registered Democrats participated, with 41% of registered Republicans turning out. A quarter of those registered with third parties turned out, and nearly a quarter of those registered as No Party Preference participated in the Los Angeles County March primary. Greater proportions of each category of party registration turned out in the March primaries in both the other VCA counties, and statewide.

Next, in Figure 4.9 and Appendix Table A17 we provide data on turnout by gender, for registered voters in Los Angeles County and the other VCA counties. In both Los Angeles County and the other VCA counties, we find that for those registered voters where we have been provided a gender estimate, that turnout was higher in the primary for female registered voters relative to male registered voters.

Finally, we show in Figure 4.10 and Appendix Table A18 turnout among registered voters in the March 2020 primary for all Congressional districts in Los Angeles County. We see

Figure 4.10: Turnout by Congressional District

that voter turnout was greatest in CD 26, with over 51% of registered voters participating in the primary election in that district. CD 33 had the second-highest turnout among Congressional districts, with 48% of voters participating in the primary. Congressional districts 40 and 44 had the lowest turnout in the March 2020 primary in Los Angeles County, both at 28%. The differences in voter participation across the Congressional districts could be due to many factors, including the competitiveness of the candidate races, which should be the subject of future research.

4.6 Conclusion

In this section we analyzed voter participation in the 2020 March primary election in Los Angeles County. Our analyses examined patterns of voter participation in recent past primary elections, and then turned to an analysis of modes of voting and voter turnout by available demographics, in the March 2020 primary election.

A summary of the important findings in this section include:

- Voter participation in Los Angeles County, among eligible voters, has been increasing in recent primary elections; voter turnout among registered voters has been increasing since the 2014 primary election.
- Voter participation in Los Angeles County for both eligible and registered voters is lower than the statewide participation rates in recent statewide primary elections.
- There has been increasing use of voting-by-mail in Los Angeles County in primary elections, though the rate of voting-by-mail in Los Angeles County is lower than that seen in the state.
- Most vote-by-mail ballots are returned by mail in the 2020 primary election, and according to the data we have, most of those arrived immediately before the March 2020 primary.
- While we have access to a limited set of registered voter attributes in the data provided for our study, we find that in Los Angeles County that voter participation is correlated with age, which is consistent with other studies of voter participation. We also see that in the March 2020 primary, Los Angeles County voters registered as Democrats or Republicans had higher turnout rates than voters registered with other parties or as No Party Preference.

5 Provisional Ballots

5.1 Introduction

In this section, we analyze provisional ballot use in the March 2020 primary and previous primary elections. The rate of voting provisionally in primary elections has decreased in Los Angeles County since 2016, and this is likely a result of LACRR/CC's VCA implementation. After describing the number of provisional voters from the statewide reports, we analyze the recorded reasons for the provisional ballots. In particular, some of the 2020 provisional ballots were cast because of synchronization issues in vote centers between the electronic pollpad devices and the central voter data, which we describe below in this section and also later in Section 9 of this report. Finally, we show provisional ballot use by age and political party, and then conclude.

5.2 Provisional ballot use in recent past primaries (June 2016 and June 2018)

According to a post-election report published by LACRR/CC, 236,788 provisional ballots were approved and subsequently counted for the June 7, 2016 presidential primary in Los Angeles County. And 35,369 provisional ballots were rejected for various reasons, according to figures provided to us by LACRR/CC. In total, over 270,000 provisional ballots were cast.

According to the provisional ballot file by VoteCal, 134,945 provisional ballots were approved and subsequently counted for the June 5, 2018 statewide primary in Los Angeles County. And 11,009 provisional ballots were rejected for various reasons, according to figures provided to us by LACRR/CC. In total, over 145,000 provisional ballots were cast. The number of provisional votes, as well as its percentage of all ballots cast, decreased from 2016 to 2018. As we show below, this also occurred between 2018 and 2020.

5.3 Provisional ballot use in March 2020

For the 2020 primary election we have additional data from the LACRR/CC's ePulse system, and our analysis is taken largely from the report by Alvarez, Guth, Kann and Kim (2020). We compare this ePulse data to the statewide provisional reports where possible, but we cannot directly match voters between them due to data limitations.

Using the VPH Provisional Report from March 31,⁶ there were 82,958 provisional ballot attempts, but only 69,013 provisional votes were listed from the statewide report.⁷ There were 2,122,469 votes cast in the 2020 primary, which means that only 3.25% were provisional ballots. The VCA, by allowing voters to vote at any vote center, has resulted in Los Angeles voters being increasingly likely to cast live ballots instead of provisional. As we describe in section 5.4, however, some of these provisional votes arose because of synchronization issues between the electronic poll pads used in the vote centers and the central voter registration database.

Figures 5.1 and 5.2 provide data on when provisional ballots were cast in the March 2020 primary, and the reason for the provisional ballot (Figure 5.1 for those in early voting before Election Day, and Figure 5.2 for those on Election Day). We can also use this data to understand when provisional ballots were cast: 79.1% of all provisional ballot attempts were reported on Election Day. This is higher than the concentration of in-person voting on Election Day as opposed to the early voting period, which is 72.8%. The rest of the provisionals are also concentrated in the last three days of early voting, with less than 4% of provisionals cast during the early voting period. This pattern is expected given that provisional voters are more likely to have not received advance voting materials and turn out to vote on Election Day.

5.4 Reasons for provisional ballot use

Table 5.1 provides the distribution of reasons for having to vote provisionally, with the second column listing reasons for all provisionals (this table is from Alvarez, Guth, Kann and Kim 2020).

Table 5.1 provides an overview of provisional ballots cast. The third column shows the reasons only for provisional voters who are conditional registrants (60.9% of all provisional voters), and the fourth column for other provisional voters (39.1% of all provisional voters).⁸ The distinction between conditional registrants and other provisional voters

⁶Report was exported at 11:48pm. While the total count of provisionals at that time was 82,958, there were many voters who had different attempts to vote provisionally at the same location at different times. There were 4,502 such records—all tables and figures include these records.

⁷Based on correspondence with Stephen Murray from the LA County Registrar-Recorder/County Clerk's office, many of these provisional ballots reported in the ePulse system that were due to pollpads losing connectivity were flagged as 'false' provisionals once they reached the county elections office and were passed on as live ballots. This means that the approximately 13,945 vote difference is due to provisional ballots that were either not counted or were flagged as 'false' provisionals at the county level and were counted as live ballots. Unfortunately, we cannot directly match the two data sets because of missing data in the ePulse provisional report of 'State ID' numbers, and so the ePulse analysis below includes these vote attempts that were ultimately not passed on as provisional votes.

⁸The merged file for Table 5.1 was created by eliminating duplicates in the added voter file when *Name*, *Precinct*, and *Address* were identical, and then merging with the provisional records on the same three

Figure 5.1: Provisional Votes Before Election Day

Figure 5.2: Provisional Votes on Election Day

Table 5.1: Reasons for Provisional Ballots, VPH Provisional Report of March 31, 2020

Reason for Voting Provisionally	All Voters	Conditional Registrants	Others
(Blank)	56.10	91.23	1.48
PollPad Offline	35.89	8.00	79.25
Voted	5.89	0.69	13.98
VBM-returned	1.49	0.00	3.80
PollPad Offline, Voted	0.51	0.08	1.18
PollPad Offline, VBM-returned	0.06	0.00	0.16
No ID	0.05	0.00	0.14

Note: Quantities are percentages.

help distinguish about 50,000 voters who would have voted provisionally regardless of any technical or vote-center specific issues. These newly added voters make up 5% of in-person voters during the primary.

To give voters the ability to vote at any location, each vote center’s electronic poll pads need to be connected to the central voter database, and to synchronize data with the central voter database. This allows it to identify the voter, give them the correct ballot, and mark them as having cast a ballot. However, there were issues with this connectivity, and with the ability of electronic poll books to synchronize data with the central voter database, as our research group observed in-person (Alvarez, Guth, Kann, Kim and Li, 2020). We show the temporal distribution of reasons for provisional ballots to see how the connectivity issues arose over the early voting period and on Election Day. In Figures 5.2 and 5.1, we plot stacked histograms of the provisional vote reason hourly on Election Day and hourly for all early voting period. There were provisional ballots cast throughout the voting period because PollPads were “offline.” As described in our observational study and our ePulse report, vote center staff were sometimes able to fix the problem by restarting or syncing the PollPads, but as can be seen, connectivity and synchronization were a constant problem throughout the March 2020 primary, resulting in provisional ballots being utilized (Alvarez, Guth, Kann, Kim and Li, 2020; Alvarez, Guth, Kann and Kim, 2020).

In Appendix Table A29 we provide detailed data on regular and provisional vote counts by vote center in the March 2020 primary.

fields. All individual provisional reports were kept, so an added voter could have been matched to multiple provisional records. This merged file was then deduplicated based on identical *Name*, *Address*, *Ballot Style*, and *Precinct*.

5.5 Analysis of provisional ballot use by voter demographics

From the VoteCal data we have the age and political party of provisional voters. Figures 5.3 and 5.4 display the rate of provisional ballots by age and party registration, respectively. In Figure 5.3 we see that younger voters are more likely to end up voting provisionally. Figure 5.4 shows that voters registered with third parties or as No Party Preference are more likely to cast a provisional ballot than those registered with either major party. These demographic and partisan registration patterns for provisional voting require further study.

5.6 Conclusion

In this section we examined provisional voting in the March 2020 Los Angeles primary and compared it to the June 2016 and June 2018 primaries. We showed that provisional voting decreased in the March 2020 primary, which is attributable in part to the VCA. However, we also note that many provisional ballots cast in the March 2020 primary in Los Angeles County arose because of technical issues in the vote centers, as electronic pollpads had trouble synchronizing data with the central voter database. Thus, there are still ways to reduce the number of provisional voters in future elections by resolving the synchronization issues between the electronic poll pads and the central voter registration database. Finally, we showed that younger voters and voters not registered with the two major parties are more likely to use a provisional ballot.

6 Ballot Rejections

6.1 Introduction

This section of our report examines ballot rejections in Los Angeles County primary elections, focusing mainly on data from the March 2020 primary. We explore ballot rejections of both provisional and VBM ballots, although this may not encompass all ballots that were ultimately rejected in the 2020 primary. After describing the reasons for different types of ballot rejections, we analyze whether ballot rejections were related to demographic information like age or party, and then we conclude.

6.2 Ballot rejections in recent past primaries (June 2016 and June 2018)

As we noted in Section 5, for the June 7, 2016 presidential primary in Los Angeles County, 236,788 provisional ballots were approved and subsequently counted while 35,369 provisional ballots were rejected. This means approximately 87% of the more than 270,000 provisional votes cast in that election were ultimately counted. Among the provisional ballots rejected, 18,508 cases correspond to voters who were not registered to vote in the June 7, 2016 presidential primary election. As for vote-by-mail ballots, according to the voter participation statistics by county published by the Secretary of State Office, 722,079 vote-by-mail ballots were counted for the June 7, 2016 presidential primary in Los Angeles County. And 11,350 vote-by-mail ballots were rejected for various reasons, according to figures provided to us by LACRR/CC. This indicates over 98% of the more than 730,000 mail ballots cast in that election were ultimately counted.

For the June 5, 2018 statewide primary in Los Angeles County, 134,945 provisional ballots were approved and subsequently counted while 11,009 provisional ballots were rejected, as we noted in Section 5. This means around 92% of the more than 145,000 provisional ballots were ultimately counted, indicating a higher acceptance rate relative to 2016. Among the provisional ballots rejected, 5,756 cases correspond to voters who were not registered to vote in the June 5, 2018 statewide primary election. This means around 4% of the provisional ballots correspond to voters who were registered but whose ballots were rejected for other reasons. As for vote-by-mail ballots, according to the voter participation statistics by county published by the Secretary of State Office, 665,075 vote-by-mail ballots were counted for the June 5, 2018 statewide primary in Los Angeles County. And 9,342 vote-by-mail ballots were rejected for various reasons, according to figures provided to us by LACRR/CC. This indicates over 98% of the more than 670,000 mail ballots cast in that election were ultimately counted.

For the rest of this section, we examine ballot rejections of both provisional and VBM bal-

lots primarily using data from VoteCal. We note that provisional ballot rejections reflected in the VoteCal data include only voters who were registered to vote in the corresponding elections (either registered before the deadline to register or through conditional voter registration). We discuss the differences between the VoteCal data on rejected ballots and the data provided by LACRR/CC below.

6.3 Ballot rejections in March 2020

For the March 2020 Primary, we have the statewide data from VoteCal as well as the ePulse reports for LA County. From the statewide data, for that election there were 69,013 provisional votes cast, of which 2,632 were rejected, which means that 96% of provisional votes were accepted. There were 1,165,310 votes cast by mail of which 23,025 votes were rejected, meaning 98% of vote-by-mail ballots were ultimately counted.

Ballot Rejection Rates – Provisional Ballots

2018 and 2020 Primary Elections

Source: Provisional Ballot File, VoteCal

Figure 6.1: Rejection Rates of Provisional Ballots

In Figures 6.1 and 6.2 we show the rate of ballot rejections graphically for the March 2020 Primary for LA County, all other VCA Counties, and the entire state. While Los Angeles County and other VCA counties have a higher rate of provisional ballots rejected in 2020 than the state average, we note that this may be due in part to LA and other VCA counties having significantly fewer provisional ballots than the state in that election. Los Angeles County also had a higher rejection rate for vote-by-mail ballots than the state average in

Ballot Rejection Rates – VBM Ballots

2018 and 2020 Primary Elections

Source: Vote-by-Mail Ballot File, VoteCal

Figure 6.2: Rejection Rates of VBM Ballots

the 2018 primary, but this was not the case in 2020 where LA, the VCA counties, and the state all had approximately equal vote-by-mail ballot rejection rates.

In Appendix Table A29 we provide detailed data on spoiled and canceled vote counts at each vote center in the March 2020 primary.

6.4 Reasons for ballot rejections

We first analyze reasons for provisional and vote-by-mail ballot rejections in the March 2020 primary using statewide data from VoteCal. In Figure 6.3, we see that most provisional ballots are rejected because the voter already voted, which means their vote may ultimately be counted without any further action necessary. For the other rejection reasons, whether the ballot is missing from the envelope (which was much higher in LA County than the rest of the state), there is no voter signature, or the ballot was otherwise incomplete, this requires action on the part of the voter to complete their ballot.

In Figure 6.4 we show that by far the most common reason why vote-by-mail ballots were not accepted was that they were not received on time. LA County has few vote-by-mail ballots rejections because of non-matching signatures, in contrast to the rest of the state, but the data indicate that the rate of vote-by-mail ballot rejections because of a

Ballot Rejection Reasons – Provisional Ballots

Ballot Rejection Reasons – VBM Ballots

2020 Presidential Primary

Source: Vote-by-Mail Ballot File, VoteCal

Figure 6.4: VBM Ballot Rejection Reasons

missing voter signature is similar to or slightly higher than seen in the rest of the state. As described above for provisional ballots, ballots that were rejected because the voter already voted are a slightly different category from the other rejection reasons; this is because that voter might have their other ballot counted and not need any further action. For ballots that don't have a signature, the voter can take action to ultimately cast their ballot, but there is no such remedy for vote-by-mail ballots that were not received on time.

Finally, in Tables 6.1 and 6.2 we show the reasons that ballots were either spoiled or canceled. It is unclear how many of those reasons ultimately resulted in the voter not being able to cast a live ballot, but the cancelled ballots that are due to failures to load them into the ballot marking device or because the QR code was out of position were issues raised in Alvarez, Guth, Kann, Kim and Li (2020). Those issues were unlikely to prevent voters from voting with either a new ballot or on a different ballot marking device, but that takes time and may require attention from vote center staff, and in aggregate these issues can lead to longer wait times for voters.

Table 6.1: Los Angeles 2020 Primary ePulse Data on Spoiled Ballots

Reason for Spoiling	Number of Spoiled Ballots	Percentage of Spoiled Ballots
Ballot Destroyed	7083	36.30%
Voter Selected Wrong Party	5279	27.03%
Spoil After BMD Review	3256	16.67%
Voter Left without Voting	323	1.65%
Other	3583	18.35%

Table 6.2: Los Angeles 2020 Primary ePulse Data on Cancelled Ballots

Ballot Cancelled Reason	Number of Cancelled Ballots	Percentage of Cancelled Ballots
Failed To Load In BMD	5326	27.36%
Qr Code Out Of Position	4986	25.62%
Wrong Voter Checked In	2621	13.47%
Qr Code Faded Print	1627	8.36%
Wrong party selection chosen	2	0.01%
Other	4898	25.18%

For June 2018 and June 2016 primaries, we obtained additional data on provisional and vote-by-mail ballot rejections from LACRR/CC. Reasons for ballot rejections are presented in Table A30 and Table A31 in the appendix (note that the categories are slightly different from those used by VoteCal). The main reasons for vote-by-mail ballot rejections in these earlier elections are similar to those in 2020. Most vote-by-mail ballot rejections come from ballots that were returned too late or ballots that lack voter signatures. The prime reason for provisional ballot rejections (among voters who were registered to vote) in 2018 and 2016 primaries, however, is different from 2020. In particular, a much larger

fraction of provisional ballot rejections in 2020 primaries come from voters who already voted, compared to 2018 and 2016 primaries. This may be due to the implementation of VCA in Los Angeles County and warrant further research.

6.5 Analysis of rejected ballots by voter demographics

In Figures 6.5 and 6.6 we show the vote-by-mail ballot rejection rates by age and party, respectively. We observe that the vote-by-mail ballot rejection rate is highest for the youngest age group and that the rejection rate is lower for older voters. Because most of the vote-by-mail ballots were rejected for not being received on time or not having a voter signature, it is likely that older voters, who may have more experience voting, may be more aware of these requirements.

When we look at vote-by-mail rejection rates by party, Republican ballots were the least likely to be rejected in the March 2020 primary, followed by ballots from registered Democrats. We see that in Los Angeles County the vote-by-mail ballot rejection rates were highest from voters registered with a party other than the Democrats or Republicans, or voters registered with no party preference.

Next, we turn to provisional ballot rejection rates by age (Figure 6.7) and by party registration (Figure 6.8). We see that provisional ballot rejections are relatively low for younger voters (those 18 to 19, and 20 to 34) in the March 2020 primary in Los Angeles County, but are higher for older voters (in particular those 65 and older). Regarding party registration, we see in Figure 6.8 that the provisional ballot rejection rate was lowest for Democratic voters, but was highest for voters registered with parties other than the Democrats or Republicans, and for voters registered with no party preference.

6.6 Conclusions

In this section we analyzed ballot rejections in Los Angeles County, compared to other VCA Counties and the state average. In the 2018 and 2020 primary elections, Los Angeles had significantly lower ballot rejection rates than the 2016 primary election. Approximately 96% of all provisional votes and 98% of all vote-by-mail ballots in Los Angeles County were accepted in the 2020 primary election. We also find that in the March 2020 primary, both provisional and vote-by-mail ballot rejection rates were slightly lower than they were in the 2018 primary election.

Then we examined the reasons for ballot rejections. For provisional ballots, the most common reasons for rejection are that the voter already voted or the ballot was missing from the envelope. For vote-by-mail ballots, the primary rejection reason was that the ballot was not received on time, or it did not have a signature.

Finally, we examined provisional and vote-by-mail ballot rejection rates by voter age and party registration. We found that younger voters in Los Angeles County had higher rates of vote-by-mail ballot rejection than older voters, and that voters who were not registered as Democrats or Republicans, or who were registered with no party preference, had higher rates of vote-by-mail ballot rejection than Democratic or Republican registered voters. On the other hand, we found that provisional ballot rejection rates were higher for older voters than for younger voters in Los Angeles County, and that provisional ballot rejection rates were higher for voters registered with no party preference or who were not Democratic or Republican registered voters.

7 Outreach Activities for the March 2020 Primary Election

7.1 Introduction

As noted earlier in this report, for the March 2020 primary, LACRR/CC implemented two different, but related, initiatives. One of those was the Voting Solutions for All People (VSAP) program, which for the March primary election rolled out vote centers for Los Angeles County voters, including new voter check-in and ballot marking technologies in the vote centers. The second was LACRR/CC's implementation of the California Voter's Choice Act (VCA), which provided for the vote center process, and expanded opportunities for registered voters to receive and return vote-by-mail ballots.

For the March 2020 primary, LACRR/CC engaged in a multifaceted voter outreach program, designed to provide Los Angeles County voters with detailed information about the new VSAP voting process and technologies, as well as about the different opportunities for voting provided by the VCA. In the sections that follow, we provide an overview of the LACRR/CC voter outreach efforts prior to the March 2020 primary election, relying upon available information.⁹

7.2 Media outreach

One key component of the LACRR/CC outreach activities was to issue news releases in 2019 and 2020, which are currently archived on the LACRR/CC website (<https://lavote.net/news-room/news-releases>). In 2019, LACRR/CC issued eleven news releases about the VSAP program, focusing on VSAP project milestones, community outreach and mock election activities, public hearings, and the availability of the LACRR/CC Election Administration Plan.

In 2020, the LACRR/CC issued one news release for the VSAP project, posted on January 24, 2020, announcing the California Secretary of State's approval of the VSAP voting technology for use. Also in 2020, for the March 2020 primary election, LACRR/CC issued 24 news releases — most of them providing public notice of candidate filing deadlines, registration and mail ballot request deadlines, and then announcements for various stages of the post-election ballot tabulation process. LACRR/CC also issued news releases to announce an issue with a missing ballot measure on some vote-by-mail ballots (discussed below in Section 9.1), to announce that vote centers would remain open for voters who

⁹Our analysis in this section relies primarily on the updated and amended Los Angeles County Election Administration Draft Plan, last amended February 19, 2020, and other information that we were able to obtain online. The complete Plan can be found online at https://vsap.lavote.net/wp-content/uploads/2019/12/EAP_AMENDED_12-9-19_Final.pdf.

arrived before 8pm on Election Day (also discussed below in Section 9.1), and on March 5, 2020 to respond to issues that arose before and on Election Day.

According to the Election Administration Plan for the 2020 March primary, LACRR/CC engaged in considerable outreach efforts with respect to broadcast and print media, including local television, radio, and newspapers. A number of these are broadcast media outlets in various languages, serving in particular Spanish, Chinese, and Korean communities.

Specifically, a report from the LACRR/CC summarized their media outreach strategy for the 2020 primary, which ran from January 7, 2020 to March 3, 2020. The media outreach strategy had three phases with different themes:¹⁰

- Phase 1: Voting is Changing
 - Dates: January 7 - February 2
 - Themes: Check voter registration and/or register to vote.
- Phase 2: Vote by Mail
 - Dates: February 3 - February 17
 - Themes: Register to be a vote-by-mail voter.
- Phase 3: Early Voting
 - Dates: February 18 - March 3
 - Themes: “Vote Early, Today, Now!” and Election Day.

During this campaign, LACRR/CC used a large number of media and entertainment platforms, which we summarize in Table 7.1. In the table we provide a summary of the platform, the number of tracked impressions (if available), and whether they used non-trackable advertising methods.¹¹

In summary tabular form, Table 7.1 compresses what was a broad and quite expansive outreach effort into simple impressions. Each of these campaigns, though, involved different communication approaches, and we do not attempt to show the complexity of

¹⁰This report was provided to our research team by LACRR/CC, and is available from the authors upon request.

¹¹Some advertising media, like digital advertising, can track the number of impressions, that they receive. The LACRR/CC report provides impressions data for trackable advertising media, which we provide in the table. When the particular media outlet does not engage in trackable advertising, we list the type of non-trackable advertising so as to provide the best summary picture of LACRR/CC advertising and outreach efforts.

Source: Report from LACCRR/CC

those different communications strategies in the table (that information is available in the LACRR/CC report, available from the authors upon request). For example, the iHeart Media campaign, which generated a very large number of impressions (339,342,267) did so using audio (including multicultural radio, traffic and weather; Clippers and NFL, podcasts, and streaming audio), digital (streaming, email, newsletters, social media posts), billboards, and other forms of video and television. Many of the media campaigns involved in-person events, and of course, outlets like the Los Angeles Times were used for their widespread print advertising capabilities (LACRR/CC conducted four campaigns with the Los Angeles Times Media Group: two half-page color ads in Sunday edition; four full-page color ads in the Glendale News-Press Wednesday and Saturday editions; an advertisement in the 2/25/2020 Special Kobe Edition of the Los Angeles times, and two Saturday edition inserts in the Los Angeles Times en Español. As is clear from Table 7.1, the breadth and reach of the media effort for the March 2020 primary election in Los Angeles County were extensive.

Also, LACRR/CC maintains an active social media presence, and their social media chan-

nels were used for outreach efforts prior to and during the March 2020 primary. The LACRR/CC social media platforms include Facebook (facebook.com/LACountyRRCC), Instagram (lacountyrcc), YouTube (lacountyrcc), and Twitter (LACountyRRCC). These social media channels provide important outlets for outreach. These platforms had the following followers (as of October 5, 2020):

- Facebook: 7,810 “likes” and 8,928 followers.
- Instagram: 3,755 followers.
- YouTube: 452 subscribers.
- Twitter: 8,166 followers.

At this time, we do not have data on how frequently LACRR/CC used their direct social media channels for outreach in the March 2020 primary, nor what the audience reach was for direct use of these social media platforms before and during the primary election.

Also, LACRR/CC used other public relations and advertising approaches, including advertisements in locations which audience reach (for example, on mass transit in Los Angeles County), as well as public service announcements. At this point we do not have detailed data regarding the use of these different public relations and advertising approaches, nor their potential reach before the March primary.

7.3 Mail outreach

LACRR/CC engaged in various direct mail outreach efforts for the March 2020 primary election. In late 2019, a direct mailing was sent to registered No Party Preference voters to inform them about how to engage in “crossover voting” in the presidential primary election; this mailing was sent to 762,582 registered voters.¹²

Direct mail was also sent to registered voters who resided in “shared” U.S. Congressional or state legislative districts, due to requirements in the VCA. These “shared” districts were ones that spanned Los Angeles and Orange Counties, and all registered voters in these “shared” districts received a ballot in the mail for the primary election. LACRR/CC sent post card mailings to the registered voters in these areas, informing them that they will receive a ballot in the mail, which they could vote and return, or that they could vote in any vote center in Los Angeles County.

¹²Details can be found in the following news release: https://lavote.net/docs/rrcc/news-releases/03032020_npp-crossover-mailing.pdf.

Next, in January 2020, LACRR/CC mailed sample ballots to all registered voters as of that date (5,477,007 sample ballots). Subsequent to that direct mailing, LACRR/CC also sent each household/postal patron a detailed guide to the location of all vote centers in the County for the primary election, including the days and times that those vote centers would be open. Finally, each registered voter also received a direct mailing that was more personalized, listing the six vote centers that were closest to the registered voter's residential address.¹³ The next major direct mailing started in early February, when LACRR/CC began to mail vote-by-mail ballots to those registered voters who requested a ballot, to permanent vote-by-mail voters, and to other registered voters who lived in areas of the county where LACRR/CC was required to provide a vote-by-mail ballot. There were 3,430,940 vote-by-mail ballots issued, according to information provided in a LACRR/CC news release.¹⁴

Additionally, LACRR/CC also used direct mail in early February 2020 to notify registered voters in Pomona and Hawthorne that their original vote-by-mail ballots omitted a ballot measure. All of the registered voters who received an incorrect ballot then received an Official Supplemental Ballot in the mail, that contained information on the missing measure, as well as instructions for how to mark and return both their original and Official Supplemental ballots. This omitted ballot measure issue is discussed below in Section 9.1, and more details about the direct mail used to inform affected voters are available online.¹⁵

7.4 Community engagement activities

LACRR/CC maintains an active community engagement effort, which for the March 2020 primary, took a number of different forms. First, LACRR/CC has relationships with various other county and city agencies, which are involved as partners to assist LACRR/CC in outreach and messaging. Also, LACRR/CC has established a Community Voter Outreach Committee, which has a large number of members from many community groups and other stakeholders in Los Angeles County. These community engagement and relationship-building efforts exist across election cycles, and were not specific to the March 2020 primary.

Second, for the implementation of the VSAP program, LACRR/CC implemented a community engagement effort that included public presentations at a number of major community events prior to the primary election, to discuss the new VSAP technologies and procedures. LACRR/CC also held a Mock Election on September 28-29, 2019, in 50 vote center locations throughout the County. These Mock Elections gave participants an op-

¹³Details are provided at https://lavote.net/docs/rrcc/news-releases/03032020_sbb-mailing.pdf.

¹⁴See https://lavote.net/docs/rrcc/news-releases/03032020_VBM-Mailing-EV.pdf.

¹⁵See https://lavote.net/docs/rrcc/news-releases/03032020_Pomona.pdf.

portunity to check in using the new e-pollbook devices, and to mark and cast a ballot using the new VSAP ballot-marking devices.¹⁶ After the Mock Election, various Demonstration Centers were established countywide, between October 2019 and January 2020, to allow further community engagement with the new VSAP technologies and procedures.

Third, LACRR/CC conducted a pilot project during the November 5, 2019 local and municipal elections held in Los Angeles County. This pilot project gave LACRR/CC the opportunity to test VSAP voting equipment and procedures in the context of these local and municipal elections, and to gather a significant amount of data about the functionality of the VSAP technologies and procedures, as well as collecting data from voters regarding their experiences with the new VSAP technologies and procedures.¹⁷

Fourth, LACRR/CC's implementation of the VCA also produced significant community engagement efforts. One of the most significant of these was the Vote Center Placement Project, in which the LACRR/CC worked to collect public input regarding where the vote centers for the March primary should be located. There were a large number of community meetings countywide that gave the public the opportunity to learn more about the VCA and the vote center process, as well as to provide input about potential vote center locations. Other public input was gathered as part of this process, from voters and other stakeholders, which is another form of outreach and community engagement. Details about the many community events are provided in the Election Administration Plan. At this point, we do not have detailed data regarding how many individuals participated in the many community events held in advance of the March 2020 primary, regarding VCA implementation and VSAP outreach.

7.5 Online website outreach

LACRR/CC provides a great deal of information and material, about present and past elections, on their website (<https://lavote.net/home/voting-elections>). The website provides information and applications for voter services like registration and vote-by-mail request, as well as tools for helping registered voters find a nearby vote center. On the website are also informational materials for voters about registration and voting, voting options for various communities, and information for election workers and those interested in running for office. Also, the LACRR/CC website contains a great deal of information about the VSAP program. At this time, we do not have detailed data on website use before and during the March 2020 primary.

¹⁶Three members of our research group participated in the Mock Election, and provided detailed feedback to LACRR/CC about their experiences and observations.

¹⁷A complete report about the pilot program is available at <https://lavote.net/docs/rrcc/board-correspondence/12192020.pdf>.

7.6 Language assistance and accessibility

LACRR/CC's outreach activities for the March 2020 primary also included materials, events, and other efforts targeting voters who prefer to use languages other than English, and for voters with disabilities. As these topics are covered by other studies of VCA implementation, we refer readers to the other studies for more information about outreach efforts to these communities.

7.7 Conclusion

The Los Angeles County Registrar-Recorder/County Clerk's office engaged in a substantial and multifaceted public outreach effort prior to and during the March 2020 primary election. One component of this outreach effort was to engage the community in the VSAP process, and to inform the community about the new VSAP technologies and procedures. A second component of this outreach effort was specific to the March primary itself, aimed at informing the community about their participation options, and providing various other types of information about the primary election. LACRR/CC used a wide variety of approaches for these outreach efforts, including the use of broadcast media, newspapers, radio, social media, direct mail, and community events. For the purposes of this report, we were unable to obtain detailed data about the reach and audience engagement for these outreach efforts.

8 Instances of Voter Fraud

8.1 Introduction

Voter or election fraud is difficult to study (Alvarez, Hall and Hyde, 2009). For the purposes of our report, we searched for news media reports of allegations of fraud, searched for news advisories or reports from law enforcement agencies who would investigate voting or election fraud, and requested information from the California Secretary of State Elections Investigation Fraud Unit. Our efforts produced no public reports of election or voting fraud allegations in relation to the March 2020 primary election in Los Angeles County.

8.2 Analysis

First, a search of the Los Angeles County District Attorney's Media Releases and Advisories (<https://da.lacounty.gov/media/news>) does not return any public notifications of charges filed, cases brought to court, convictions, or any other information regarding voting or election fraud in the March 2020 primary in Los Angeles County.

Second, an internet search for news reports regarding allegations of election or voter fraud in the March 2020 primary in Los Angeles County did not find any mentions of allegations in the primary election.

Third, our research group sent a formal request for information regarding allegations of election or voting fraud to the California Secretary of State Elections Investigations Fraud Unit on August 14, 2020. As of the time of the drafting of this report we have not received any information in response to our request.

8.3 Conclusions

We have been unable to find any allegations of election or voter fraud in the March 2020 primary election in Los Angeles County. Election and voting fraud is difficult to study, and the absence of allegations or public reports does not provide definitive evidence that allegations of election or voter fraud in the primary election may not arise at some future date. However, we note that at the point we write this report, the absence of allegations is an indication that it is unlikely that significant election or voter fraud occurred in this election.

9 Problems During the Primary and Canvass

In this section of our report, we start by presenting some data collected by academic colleagues directly from Los Angeles County voters, during or immediately after the March 2020 primary. These data indicate that most voters who participated in the March 2020 primary had positive experiences.

We then discuss other research that our group conducted during and after the March primary, as well as research that was simultaneously conducted by LACRR/CC about specific issues that arose in some vote centers during the primary election. These issues were manifest in the form of lines and longer wait times than anticipated at some vote centers. These wait time and line issues in the vote centers occurred because of issues with the electronic pollbooks used in the vote centers; they had issues synchronizing data with the voter database. There were other minor issues that arose during the primary that we also discuss in this section.

9.1 Voter experiences in vote centers and on Election Day

Researchers from Loyola Marymount University (LMU) conducted an exit poll at 50 selected vote centers, interviewing 3,596 subjects (Guerra et al., 2020). The exit poll contained questions about the voting experience, and problems that voters may have faced at vote centers on Election Day. Importantly, when asked “How would you rate your overall experience at the vote center today,” 87.1% said that their experience was excellent or good; 8.8% rated their experience as fair, and 4.1% as poor. These survey results imply that the vast majority of Los Angeles County voters likely had a positive experience at vote centers on March 3, 2020. Keeping in mind the large number of voters in the March primary, and that about 980,000 in-person voters participated in the primary, extrapolation of these percentages to population estimates indicates that perhaps 38,000 in-person voters may have felt that they had a poor voting experience at vote centers.

The LMU exit poll later asked respondents about six different aspects of their experience at the vote center on Election Day. The responses to those questions are provided in Table 9.1. Overall, respondents to this survey rated their experiences quite positively: over 80% said that deciding where to vote, finding their vote center, and using the new machines to print and cast their ballots were very easy. Also, for each of those, when we also consider respondents who rated their experiences as somewhat easy, approximately 95% of respondents found deciding where to vote, finding their vote center, and using the new machines to print and cast their ballot were easy.

It is important to note, though, that when it came to parking at their vote center, registering or checking in with the e-pollbook, and using the new machines to mark their ballots,

there were slightly greater percentages of voters participating in the LMU exit poll who found each of these to be somewhat or very difficult. In particular, we note that 7.1% of respondents in this survey found registering or checking in to be somewhat or very difficult.

Table 9.1: Voter Experiences on Election Day

<i>Deciding where you were going to vote:</i>			
Very easy	Somewhat easy	Somewhat difficult	Very difficult
81.0	14.2	3.7	1.0
<i>Finding your vote center:</i>			
Very easy	Somewhat easy	Somewhat difficult	Very difficult
84.9	11.7	2.6	0.8
<i>Parking at your vote center:</i>			
Very easy	Somewhat easy	Somewhat difficult	Very difficult
74.4	17.2	5.8	2.6
<i>Registering or checking in to receive your ballot (e-pollbook):</i>			
Very easy	Somewhat easy	Somewhat difficult	Very difficult
76.4	16.5	4.5	2.6
<i>Using the new voting machines to mark your ballot:</i>			
Very easy	Somewhat easy	Somewhat difficult	Very difficult
79.2	17.0	2.4	1.4
<i>Using the new voting machines to print and cast your ballot:</i>			
Very easy	Somewhat easy	Somewhat difficult	Very difficult
80.1	15.3	3.1	1.5

Source: Guerra et al. (2020)

The LMU survey also noted another potential issue in vote centers on Election day: long lines. The survey asked respondents how many minutes they spent in line at the vote center. While a plurality of respondents did not wait very long (43.2% said they waited 5 minutes or less), 17.8% said they waited 6 to 10 minutes, and 7.6% waited 11 to 15 minutes. But 9.2% said they waited 16 to 20 minutes, and 22.2% said that they waited more than 20 minutes. It is the latter estimate that we wanted to highlight, which is consistent with other data and research that we will discuss later in this section.

Additionally, the UCLA Luskin Center conducted a Los Angeles County Quality of Life survey (N=1,503) in late March 2020, and in that survey they asked those who said that they voted in the March primary how satisfied they were with their voting experience, and how long they waited in line. Like the LMU survey, the UCLA researchers found an overall very positive level of voter satisfaction: 89% said that they were satisfied with their voting experience (59% very satisfied and 30% somewhat satisfied), with only 10%

saying that they were dissatisfied (5% somewhat dissatisfied, 5% very dissatisfied). In the UCLA survey, they also asked how long voters waited in line at a vote center: 56% said they waited less than 30 minutes, 16% between 30 and 60 minutes, 13% between one and two hours, and 15% waited more than two hours.

Thus, the LMU and UCLA surveys provide important data that indicates that most voters on Election day and in vote centers had very positive voting experiences. But, both surveys also indicate that some voters were in line for a very long time when they tried to vote in person, and that some voters reported having significant difficulties checking in at the voting centers.

These issues were confirmed in other studies of the March 2020 primary. In particular, an in-person observation study conducted at 35 vote centers by researchers from the California Institute of Technology noted that lines formed at vote centers (especially on Election Day), and that those lines formed because of bottlenecks in the voter check-in process (Alvarez, Guth, Kann, Kim and Li, 2020). That study noted that there might have been issues that vote center staff had finding registered voters on the e-pollbooks, that some vote centers may have had an insufficient number of functioning e-pollbooks, and that there seemed to be e-pollbook connectivity and syncing issues. The California Institute of Technology researchers also conducted a detailed study using data provided by LACRR/CC, and in their analysis found that “in these data we see evidence of major challenges with PollPad systems in the vote centers, which when malfunctioning may have produced lines in vote centers ...” (Alvarez, Guth, Kann and Kim, 2020).

Issues with voter wait times and the PollPads were also studied extensively by LACRR/CC, and in their report they provided a more detailed analysis of the issues that arose with the electronic pollbook systems (LACRR/CC, 2020). Their report concluded:

Longer wait times primarily resulted from technical issues with the electronic pollbooks (PollPads) that are used to check-in voters as they arrive at the Vote Centers. Even though ample network bandwidth was available, the PollPads had issues synchronizing data with the voter database and the voter search function was too limited for the size of the County’s electorate. This resulted in delays as voters checked in. Also, some Vote Centers had fewer PollPads than needed to handle voter turnout on Election Day.

The LACRR/CC study concluded with a number of recommendations to resolve voter wait times issues (including better tracking of wait times in vote centers), to improve staffing and training of vote center staff, and to resolve the syncing issues that the PollPad systems experienced in the primary.

Two other issues arose in the March primary, which are also discussed in the LACRR/CC study. The first issue was the result of a programming error, where approximately 17,000

vote-by-mail voters did not receive their ballots as scheduled. This issue arose because, due to a last-minute special election in Congressional District 25 (CD25), the vote-by-mail ballots for registered voters in CD25 needed to be processed independently of those for registered voters in the rest of the county (so as to avoid any unnecessary delays in sending vote-by-mail ballots to registered voters outside of CD25). A programming issue for the CD25 vote-by-mail ballots detailed in the LACRR/CC study led to the delay in those ballots being sent on schedule.

The second issue regarded a ballot measure, Measure FD. This ballot measure was approved for the primary election ballot, in the Consolidated Fire Protection District of Los Angeles County. However, because of discrepancies between the district boundary information used to produce ballot styles for voters in the fire district and the actual boundaries of the fire district, voters in three cities and some nearby areas received ballots that did not have Measure FD. This affected 59,093 vote-by-mail voters in 64 precincts, and LACRR/CC took a number of steps to provide the correct ballots to the affected voters. However, the analysis in the LACRR/CC study found that despite the corrective steps, some voters may have used ballots that did not contain Measure FD.

9.2 Problems in the canvass

Our research revealed no reported problems in the March 2020 primary canvass in Los Angeles County.

9.3 Conclusion

Overall, in polls conducted on Election Day or after the primary election, most voters reported positive experiences when they tried to vote. However, there were issues in voting centers, in particular issues with the electronic pollbooks that led to the use of provisional ballots and lines (in particular on Election day, when turnout in vote centers increased relative to in the early voting period). These issues were noted in qualitative and quantitative studies by our research group at Caltech, and confirmed in an independent analysis by LACRR/CC. The voting center lines and wait times occurred because of issues that the electronic pollbooks had synchronizing with the voter database during the March primary early and Election Day in-person voting.

There were also two other issues that arose during the primary election, with some voters not receiving their vote-by-mail ballots as scheduled, and with some voters receiving an incorrect ballot style. There were no problems reported during the canvass that our research group has surfaced.

10 Conclusions

The March 2020 primary election was the first in Los Angeles County that used the new “Voting Solutions for All People” voting technologies and procedures. It was also the first implementation of the California Voter’s Choice Act in the County. In this report we have provided as detailed a portrait as the available data allow of this first implementation of VSAP and the VCA in Los Angeles County.

It is important to remember that Los Angeles County is one of the largest and most complex local election jurisdictions in the world. Given the size and complexity of the election administration in Los Angeles County, our overall evaluation is that the March 2020 primary election went relatively well. We note that in the two academic surveys that we had access to for this report that most voters participating in the primary election were satisfied with their voting experience. That is an important accomplishment.

We also note that there are places for improvement in future elections using the VSAP and VCA technology and procedures in Los Angeles County. The most significant issue that arose in the March 2020 primary in Los Angeles County was that some in-person voters had to wait in line, or had to cast a provisional ballot, because of data synchronization issues in the voting centers. The LACRR/CC has issued a detailed report regarding these issues, and developed an action plan to mitigate these issues from arising in future elections. We recommend that future research continue to monitor metrics like in-person voting line length and wait times, and provisional ballot use, to document that the issues seen in the March 2020 primary have been resolved.

Appendices and Detailed Data Tables

Data Sources

Most of the data that was used in the production of this report was provided by the California Secretary of State's Office (CASOS) or by the Los Angeles County Registrar-Recorder/County Clerk Office (LACRR/CC). We thank both offices for helping us acquire and use the different administrative datasets they provided.

We also used data from Political Data Inc. (PDI), and we thank PDI for access to their data. The PDI data we used in this report was originally acquired by Dr. Mindy Romero, the director of the Center for Inclusive Democracy at the University of Southern California, who is working on related VCA research. Anna Meier, from Dr. Romero's research group, facilitated access of the PDI data and helped us understand the data provided. We thank Dr. Mindy Romero and Anna Meier for their assistance and collaborative efforts.

We also use academic survey data, provided to us by colleagues at Loyola Marymount University and the University of California, Los Angeles. We thank Fernando Guerra and Brianne Gilbert from Loyola Marymount University, as well as Zev Yaroslavsky and Alisa Belinkoff Katz from UCLA's Luskin Center for History and Policy for the opportunity to use their important data in our study.

Data from CASOS

The datasets from CASOS that we used in this report include Voter Registration File, Voter Participation History File, Vote-by-Mail Ballot File, and Provisional Ballot File for the June 2018 Statewide Primary and the March 2020 Presidential Primary from VoteCal. In addition, we used data published on the CASOS website such as the Voter Participation Statistics by County.

Data from LACRR/CC

We used information regarding the number of provisional and vote-by-mail ballot rejections and the reasons for these rejections for the June 2016 Presidential Primary and the June 2018 Statewide Primary from LACRR/CC. We used reports and materials regarding LACRR/CC's voter outreach efforts provided to us by LACRR/CC. In addition, we used data published on the LACRR/CC website such as the Statement of Votes Cast for the March 2020 Presidential Primary.

Data from PDI

The dataset we used from PDI contained information on the gender and race/ethnicity of registered voters in the VCA counties.

Academic Survey Data

We received topline and cross-tabulation reports from LMU (exit poll) and UCLA (a post-election survey). Information from the topline and cross-tabulation reports was used in our study.

Ballot spoiled	61	1%	228	2%
Other	175	2%	143	1%
Total	9,342		11,350	

Tables and Figures for Race and Ethnicity

During the voting registration process, applicants can voluntarily provide racial and ethnic information. Applicants are not required to provide that information, and as a result the available race and ethnicity information in the state's voter registration database is incomplete and not validated. We were provided data from PDI that contains estimates of registered voter race and ethnicity; given that these are estimated or imputed quantities, we are cautious about their use in an evaluation study. Thus, we provide tables and figures that use the race and ethnicity information from PDI here in this Appendix. We advise that readers interpret and use this information carefully, and we encourage additional research to collect and validate racial and ethnic identifications for future election administration evaluation studies.
